

THOUGHT FURNACE

Making the world better through innovation and implementation.

The mission of Thought Furnace is to harness the vision and intellect of STEAM students, our current and future thought leaders, in creating innovations that may better life in our world.

One example discussed is the development of an App/Apps that will reduce (and move toward eliminating) the use of paper in our world, which will have positive impact/result on time, space, clutter, waste disposal and carbon emission, among other benefits.

Another is an advancement on the paper shredder - today's top shredders are very ineffective and inefficient with capacity for a limited number of sheets. I propose an advance in the current home/office shredder that will handle larger volumes of paper more efficiently. Also as an option to this, a home/office recycling machine using 3D printer technology to fabricate plates, cups and other needed life products.

These and other ideas that I propose or that emerge from this process may also lead to patents that would be owned and would benefit students their families, and all concerned.
